

Bacterial Vaginosis

FOR SELF-TESTING USE

Unpleasant vaginal odour? Test yourself for Bacterial Vaginosis.

Bacterial vaginosis is a common type of vaginal inflammation caused by the overgrowth of bacteria called *gardnerella vaginalis* naturally found in the vagina. When this happens the pH of the vagina increases.

It can affect women of any age but is most common in women of reproductive age. Common symptoms include a thin grey, white or green vaginal discharge, a “fishy” vaginal odour, vaginal itching, or burning during urination. Half of all women with bacterial vaginosis do not have any symptoms.

Bacterial vaginosis can be sexually transmitted. If you’ve recently been intimate with a new partner you might want to test for common sexually transmitted diseases or attend a sexual health clinic.

Other possible causes of an increased vaginal pH are candida (thrush) and trichomonas. Further testing may be needed in the event of a positive result.

- ✔ Simple Vaginal Swab
- ✔ Easy-to-Read Results

- ✔ Immediate results
- ✔ Detects vaginal pH (normal range 3.8 to 4.4)

- ✔ User-friendly, comfortable, and discreet design

Specification

Intended Use Biochemical assay for semi-quantitative detection of pH in female vaginal swab specimens

Storage 2-30°C

Time to Result 5 minutes

Shelf Life 2 years

Components

- 1 Test Panel
- 1 Sterile Swab
- 1 Package Insert
- 1 Test Per Pack

Procedure

I. Collect the vaginal secretions with the swab - 2 in/5 cm inside the vagina for about 10 seconds

II. Apply the head swab onto pH area of the test panel at least 5 times

III. Read the results immediately while the measurement zone is still wet
